

Project Hand-over Documentation

OneiiSysHubFEATI System

1. Project Overview

The **OneiiSysHubFEATI System** is a web-based application designed to manage and streamline various operational processes including Food and Beverage services, Room Management, and e-Wallet transactions. The system streamlines customer transactions, room operations, digital wallet management, and voucher handling. The system follows an MVC architecture and is built using Java-based technologies integrated with front-end web frameworks.

This document serves as a guide for the incoming developer or team to understand the structure, functionalities, and technical aspects of the system for smooth transition and continuity.

2. System Modules

2.1 Food and Beverage Module

This module handles all food-related operations such as menu management, ordering, and category maintenance.

Features

Manage Food Category

- Add new food categories
- Update existing categories
- Activate/Deactivate categories
- Search and filter categories

Manage Food Orders

- Create food orders
- Update order status
- View order history
- Monitor pending and completed orders

Manage Food Menu

- Add food menu items
- Upload food icons
- Set pricing and availability
- Assign category to menu items

Food Menu Orders

- Customer food ordering interface
- Quantity selection
- Order summary generation
- E-Wallet or Cash Payment

2.2 Room Module

This module handles room management and guest room transactions.

Features

Manage Room

- Add room details
- Edit room information
- Room availability monitoring
- Room categorization

Room Check-in

- QR Scan Check-in
- Check-in date/time recording
-

Room Check-out

- QR Scan Check-out
- Checkout date/time recording

2.3 e-Wallet Module

This module manages digital wallet transactions, vouchers, credits, and rewards.

Features

Manage eWallet

- Create and manage user wallets
- Wallet activation/deactivation

Manage Voucher Type

- Create voucher categories/types
- Define voucher rules and limitations

Manage Voucher

- Create vouchers
- Voucher validation
- Voucher redemption management

Manage Credit

- Credit allocation
- Credit balance monitoring
- Credit adjustment

Manage Points Earning Rule

- Configure earning mechanics
- Define reward point equivalents
- Promotional reward settings

My e-Wallet

- User wallet dashboard
- Balance inquiry
- Transaction monitoring

Manage e-Wallet Request

- Wallet approval requests
- Request tracking

Manage e-Wallet Approver

- Assign approvers
- Approval hierarchy setup
- Approval status monitoring

Transaction History

- Wallet transaction logs
- Transaction filtering
- Export transaction reports

Manage Cash In

a. Manual Entry

- Manual cash-in recording
- Transaction verification
- Amount validation

b. QR Code

- QR code generation
- QR code scanning
- Automated wallet funding

3. Technology Stack

Front-end

- HTML
- CSS
- JavaScript
- Bootstrap

Back-end

- Java
- Spring Framework (Spring MVC)

Database

- MySQL

ORM

- Hibernate

Architecture

- MVC (Model-View-Controller)

4. System Architecture Overview

- **Model Layer:** Handles database entities and business logic (Hibernate ORM).
 - **View Layer:** JSP/HTML pages styled with Bootstrap.
 - **Controller Layer:** Spring MVC Controllers managing request flow and responses.
-

5. Key Features

- Dynamic form handling with validations
 - Real-time ticket status tracking
 - Modular management system (scalable)
 - Role-based access (if implemented)
-

6. Database Overview

- Relational database using MySQL
- Key tables include:
 - room
 - room_entry
 - food
 - food_category
 - food_item_order
 - food_order_request
 - fb_item_order
 - fb_order_request
 - e_wallet
 - e_wallet_approval
 - e_wallet_approval_status_type

- `e_wallet_approver`
- `e_wallet_approver_level`
- `e_wallet_changes`
- `e_wallet_request`
- `e_wallet_request_status_type`
- `e_wallet_system_setting`
- `e_wallet_transaction_history`
- `e_wallet_transaction_status`

7. Setup Instructions

7.1 Prerequisites

- Java JDK (version 8)
- Apache Tomcat (or compatible server)
- MySQL Server
- IDE (Spring Tool Suite)

7.2 Steps to Run (Using SVN Repository)

1. Access SVN Repository

- Open your IDE (e.g., Spring Tool Suite).
- Navigate to SVN Repository Exploring perspective.
- Enter the repository URL and log in using your assigned SVN username and password.

2. Checkout Project

- Locate the **OneiiSysHubFEATI** project in the SVN repository.
- Right-click the project and select **Checkout**.
- Choose the appropriate workspace directory.

3. Import Project into IDE

- If not automatically imported, go to:
 - *File → Import → Existing Projects into Workspace*
- Select the checked-out project folder.

4. Configure Database Connection

- Update database credentials in **WEB-INF > spring > properties** > :
 - `db.local.properties`
- Ensure MySQL service is running.

5. Initialize Database

- Run the provided SQL scripts to create required tables and initial data.

6. Update Project Dependencies

- Right-click project → Maven → *Update Project* (if Maven-based).
- Ensure all dependencies are downloaded successfully.

7. Build and Clean Project

- Perform *Project → Clean* and rebuild the application.

8. Deploy to Server

- Configure Apache Tomcat in your IDE.
- Right-click project → *Run on Server* or manually add it to Tomcat.

9. Access the Application

- Open browser and navigate to:
`http://localhost:8080/oneiiSysHubFEAT`

10. SVN Best Practices

- Always **Update (Pull)** latest changes before starting work.
- Commit changes with proper comments.
- Resolve conflicts carefully before committing.

8. Configuration Details

- Database credentials located in:
 - `db.local.properties`
- Context path configurable in server settings
- Environment variables (if any) should be updated accordingly.

9. Known Issues / Notes

- Ensure proper handling of null values in Hibernate mappings.
- Lazy loading may cause `LazyInitializationException` if not handled properly.
- Front-end responsiveness may require minor adjustments for smaller screens.
- Validation scripts are partly handled in JavaScript—review before modification.

10. Maintenance Guidelines

- Follow MVC pattern when adding new features.
- Ensure proper validation on both front-end and back-end.
- Use Hibernate best practices for database interactions.
- Maintain consistent naming conventions.
- Test all modules after any update.

11. Contact / Support

For any clarifications during the transition:

- Coordinate with previous developer or project owner.
- Review codebase comments and existing documentation.

12. Conclusion

This document provides a comprehensive overview of the **oneiiSysHubFEATI System**. The system is modular, scalable, and designed for operational efficiency. Proper understanding of each module and adherence to the architecture will ensure smooth maintenance and future development.
